

Six public human DFU transcriptomic series

127 accession records mapped to 94 analytic participant units
Core bulk: GSE80178 | exact-reuse audit: GSE68183
Supporting single-cell context: GSE165816
Non-core context: GSE134431 (healing), GSE143735 (forearm),
GSE199939 (foot-skin background)

Source-object identity

Six GSE68183 controls exactly
matched GSE80178 raw objects
Duplicate labels remained
provenance, not added evidence

Comparator roles

DFU, diabetic intact foot, and
nondiabetic intact foot skin
remained distinct strata
Other contexts stayed outside

Participant-level units

Participants were the clinical
inferential units
Cells, libraries, and reused
objects were not independent n

Core bulk inference

GSE80178: 12 arrays
6 DFU, 3 diabetic intact foot,
3 nondiabetic intact foot
RMA plus limma; prespecified contrasts
Robustness required at least 2
independent compatible studies

Supporting single-cell context

GSE165816: foot skin only
14 libraries from 11 participants
7 healers and 4 nonhealers
Outcome-blinded cell annotation
Participant-cell-type pseudobulk
One global BH correction

Provenance-aware evidence assessment

One independent compatible core bulk study remained
Single-cell outcome testing supplied participant-level context
Cross-study robustness and supporting evidence remained distinct

Interpretation boundary

No cross-study gene or pathway robustness claim was estimable
Global null evidence does not establish biological absence or replication
